

Demolition

Efficient Destruction for Better Construction

Sometimes you need to tear down the old before you can build something better – and when you do, Ace is there to help. Whether you need to clear your site of native vegetation or pulverize an old, worn-out asphalt pavement, Ace's demolition experts have the tools and experience necessary to do the job right.

Our demolition team prides itself on more than efficiency. We also ensure our methods are environmentally conscious, creating as little impact as possible on the surrounding area.

If you need reliable, safe demolition work for your site, Ace Asphalt is the right choice.

Benefits

Comprehensive: Full site-work package with one company.

Efficient: Thanks to our size, we have many options of equipment and crews to handle a variety of site needs while keeping production high and your costs low.

Ahead of Schedule: Start your project timeline off on the right path with a reliable partner who has a track record of exceeding expectations.

Solutions

Site Clearing, Non-Structural Demolition & Pre-Wet:

We are as anxious to break ground as you are, but years of experience have taught us that prior planning is as critical to the success of a job as what happens while on site. This preparation includes site design and survey, obtaining proper permits, city water meter setup, identification of utilities from records and through follow-up at your physical location...because records are not always reliable. We will also mobilize dust control and SWPP measures on site prior to our work to ensure that any impact to the environment through our activities is minimized.

We are now ready to clear and pre-wet your site. Many sites contain remnants of old pavement, concrete or other surface foundations. We offer the right equipment and skills to remove these unwanted barriers as well. Whether natural or man-made forces had a hand in the condition of your site before our arrival, we will ensure it is ready for grading when we leave it.

Pulverizing:

Pulverization removes the distressed layer of existing pavement, as well as the old base material, and grinds them together to provide a recycled usable base for your new asphalt surface.

We won't just show up on your site though. Proper pre-work and planning is critical to the success of any project. Preparation for your project may include site design and survey, obtaining proper permits, city water meter setup, and mobilizing dust control and storm water pollution prevention measures.
