

Asphalt Repair

Patch, Repair - and Prevent

Today's small wear-and-tear issues could easily become tomorrow's foundational failures. While having and following a long-term preventive maintenance plan that includes sealing and crack filling will help protect your asphalt investment, you may also find times when your pavement needs repairs. After all, you can't stop Mother Nature; you can only slow her down.

We offer a full range of repair solutions when your asphalt pavement needs it most – including saw cutting, milling and wedging, trench repair and skin patching. From patching individual potholes to replacing larger distressed areas, our maintenance professionals are trained to identify your problem areas and provide the right diagnosis to prolong your surface – while minimizing the impact on your budget.

If your asphalt is showing signs of wear, don't wait – contact us for your current repair needs, and talk to us about developing a long-term maintenance plan that prevents future damage.

Solutions

Sawcutting/Partial Removal:

Asphalt deterioration typically begins in smaller areas damaged by water or other outside factors, and can quickly spread throughout your pavement. Watching for and repairing these areas early can save you a much more costly repair or entire pavement replacement later. It's a service we like to call "R&R" (remove & replace).

Milling & Edging:

Over time, older pavements may experience tripping hazards due to uneven integration of the surface to gutters, sidewalks, or other structures. Milling and wedging are tools we offer to help solve this challenge and are frequently used to tie in an asphalt overlay to your existing surface and/or concrete edging.

Trench Repair:

When utility lines below an existing pavement surface need to be fixed or installed, many times the urgency is now - or at least it seems that way. No matter the scope, we work closely with municipalities to ensure we meet or exceed soil compaction and density specifications for the subgrade so that you can be confident when the inspector shows up.

Skin Patching:

For low, depressed surfaces where the underlying foundation is structurally sound, skin patching is a viable and valuable option. We also recommend this solution for smaller, raveling areas.
