

Running Tracks

Better Tracks, Better Training

Running tracks come in all materials and shapes – including dirt, decomposed granite, asphalt and highly advanced polyurethane-based surfaces. But no matter what your track is made of, you need it to be safe – and perform for the athletes using it.

We're not only experienced at building new running tracks, but we can also handle all the custom touches your organization needs, like long jump and pole vault runways, landing areas, shot-put pads and more. Our capabilities include consultation, design, layout, grading, drainage systems, asphalt paving, concrete, latex or polyurethane surfacing, markings, and other accessories and equipment.

If your track is showing signs of deterioration or isn't up to safety standards, our experts can help you assess and repair or resurface your track, ensuring it meets compliance codes or other specifications – and provides a top-quality place to run for years to come.

Contact us to learn more about our running track surfacing abilities. If you need a track surface for a school or other public facility, contact our Public Works department, where we can ensure your project is handled correctly and meets procurement law.

Solutions

New Tracks:

Our capabilities include building off an existing set of plans, or designing a facility with the collaboration of our certified track builder. Following the design stage, we will begin obtaining permits, locating utilities, and mobilizing dust control and storm water pollution prevention measures to get ready for breaking ground. Your site is then cleared of any vegetation and/or debris and pre-wet for proper soil saturation prior to and during the earthwork phases. Next, heavy equipment is used to grade and balance your site to specification. Concrete curbing is also installed along with drainage, equipment, and event areas. The track is then paved with a hot-mix asphalt and compacted.

After curing, the track is ready for surfacing using a latex or polyurethane-bound base mat and, depending on the track design you select, polyurethane surface layers and rubber granules. We even have a top-of-the-line, solid-pour polyurethane design that runners just love. Once the surface has properly set, professional striping and customized markings such as lane numbers and corporate/scholastic logos add the finishing touches.

Track Renovation:

For tracks in need of full reconstruction, we will remove the existing surface along with the asphalt pavement and aggregate base course. See the description above for details of the remaining process. For tracks only in need of surface replacement, we will remove the old track surface and replace it with the new latex or polyurethane-bound system of your choice. A fresh re-striping and re-painting of markings complete the process.
